The present sequence represents a lectin derived progenitor cell
creservation factor. The protein is used to preserve unipotent,
crells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and class progenitor cere, skin, gut, bone,
contained cells intended for administration after
continued cells intended for administration after
continued cells intended for administration after
continued cells intended for administration and rerichment
con chemotherapy) to reconstitute the haematopoietic system; enrichment
con preserved reals (e.g. during ex vivo purging of malignant cells);
creatment of tissues containing haematopoietic progenitors for subsequent
transplant to improve haematopoietic competence; improving transfer of
transplant to improve haematopoietic competence; improving transfer of
the amantological disorders, e.g. sickle-cell anaemia); and protection
against ablative therapy (to eliminate proliferating cells specifically),
collowed by re-establishment of differentiation and proliferation of
preserved progenitors. The protein, when linked to magnetic beads, may
also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SENQTITKAASSNVVAVEFDTYLNPDYGDPNYIHIGIDVNSIRSKVTAKWDWQNGKIATA 180

The present sequence represents a FRIL (FIK2/FIt3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of chemotherapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment. Administration of FRIL compositions to a chemotherapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient of lappleting activity of the reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for therapeutic progenitor cell-depleting activity of the stem of progenitor cell-depleting activity of the stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                             Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer

Example 1; Page 59; 173pp; English.

The present sequence represents fusion protein of alpha-amylase inhibitor signal peptide and FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting clectin). The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition of signal state of FRIL family of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment, including radiotherapeutic reatment becompositions to a patient prior to treatment of the patient with a therapeutic treatment baving a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. Colls, hemangloblasts, and mesenchymal stem cells. The composition is cells, hemangloblasts, and mesenchymal stem cells. The composition is chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics and preferably recover from cancer. It is also chemotherapeutics and preferably recover from cancer. It is also condition where the patients hematopoietic progenitor cells are condition where the patients hematopoietic progenitor cells are condition where the patients hematopoietic progenitor cells are condition where combined immunodeficiency or aplastic anemia.

Example 22; Page 116-117; 173pp; English.

The present sequence is a partial a FRIL (FIRZ/FIL3 tyrosine kinase receptor-interacting lectin) protein. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or patient prior to treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment reduces the hematopoietic progenitor cell-depleting activity alleviates or treduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangloblasts, and mesenchymal isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

```
The present sequence represents a FRIL (FIR2/FIL3 tyrosine kinase ceptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell composition for alleviating or preservation factors. The composition is useful for alleviating or call captening the hematopoietic progenitor cell-depleting activity of chemotherapeutic treatment, including radiotherapeutic and/or treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity alleviates or therapeutic treatment in the patient. FRIL family members are useful for sean cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive combined to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer

                            The present sequence is that of a jack bean concanavalin A (Con A) mutein in which the Asn-152 residue of the native protein is replaced by Ser in order to disrupt a glycosylation signal. The present invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing bNA that codes for at least 1 lectin selected from Con A plant cells containing at least 1 copy of the DNA; the present lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen present beetles) of the genus Meligethes, flea beetles (pollen beetles) of the genus Meligethes, flea beetles of the genus Phyllotreta, and root flies of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  62 SAVLTSFDTIINFEISTPYTSRIADGLAFFIAPPDSVI--SYHGGFLGLFPNANTLNNSS 119

The sequences given in AAR74763-70 represent various pentraxins and legume lectins. All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum amyloid P (SAP) binding to amyloid fibrils. The similarities con the amino acid sequences of SAP, human and Limulus C-reactive protein (CRP) and female hamster protein suggests that they may have contains a structures. The jellyroll topology of the pentraxins is reminiscent of the picornavirus coat proteins which also have commanded to female lectins such as concanavaline and pealectin. Alignment of sequences on the basis of topologically equivalent features of the corrections in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. 11%. The sequences of the two families have identities of only approx. 11%. The commain helices in SAP occur before and after strand L, whereas the commain helices in SAP occur before and after strand L, whereas the commain helices in SAP occur at the C-terminus of strand. The region of strand E in the legume lectins relative to pentraxins. Strand S, and the begining of strand E in the lectins relative to pentraxins. Strand S, and the begining of strand E in the lectins relative to pentraxins. Strand S, and in the legume lectins. The so-called pentraxin contageptide signature sequence, HXCXS/TWXS, is in this region so it is not conserved in the legume lectins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     85 ADGLAFFIAPPDSVI--SYHGGFLGLFPNANTLNNSSTSENQTTTKAASSNVVAVEFDTY 142

The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           119 STSENQTTTKAASSNVVAVEFDTYLNPDYGDPNYIHIGIDVNSIRSKVTAKWDWQNGKIA 178

The invention relates to Robinia pseudoacacia lectins which can be used for medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the retacment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not including mucous membrane). Use of the lectin is effective and does not present sequence represents a R. pseudoacacia lectin RPPAI. This lectin is composed of two subunits- polypeptide a and polypeptide b

The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues (especially mucous cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         149 -----SNQIVAVEFDTFSNIHF-DFKGRHMGINVNSIVSIKTVPWNWTNGEVAN 196

                                                                                                                                                  in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of mucosal. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a R. pseudoacacia lectin RPbAII. This lectin is composed of the subunit- polypeptide c (AAY06813).
                                                                                                                                            The invention relates to Robinia pseudoacacia lectins which can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of pea cv. Lincoln lectin. The invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A (see AAYS8736), modified Con A (see AAYS8737) and pea lectin; transgenic plant cells containing at least 1 copy of the DNA; a new lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen behilds) for the genus Meligethes, flea beetles of the genus Meligethes, flea beetles of the genus Phyllotreta, and root files of the genus behilds and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5 SFSFTKFDPNQEDLIFQGHATSTNNVLQVTKLDSAGNPVSSSAGRVLYSAPLRLWE-DSA 63

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of a Bauhinia purpurea lectin which has had lysine residues replaced by other amino acids which either preserve the positive charge at the position of the substitution or provide a neutral residue. The protein derive, are effective larvicides against insect pupae, such as the European corn borer. The protein can be administered enterally to the larvae in their diet and can be see also ARA45912.

XX PERSON SECONDANIA PROBLEM CONDOUNCE IN field crops such as control insects (e.g. European corn borer) in field crops such as corn, wheat and rapeased

XX PERSON SEQUENCE PLAN SPP; English 7 lysine residues the form in the compania sequence by the replacement of one or more lysine residues with the replacement of one or more lysine residues with cother amino acid residues adainst insects such as the point of substitution. The compounds are corn ported and and stavicides against insects with a the point of substitution. The compounds are useful as larvicides against insects such as the perfect of corn borer. The BPL-derivatives are fletcitus desidues which may be protected using the BPL derivatives are corn, mailer insects which may be protected using the BPL derivatives are corn, mailer crops (such as onion, pepper, tomato, cucumber, sarial and sophem). Crops (such as onion, pepper, tomato, cucumber, sarial, and sophem). Find compounds are useful for protections and sophem). Find crops (such as melons) and vegetable crops (such as onion, pepper, tomato, cucumber, square, cucumber, strain, Manicot, bactoon) and callillower), eggplant, sphach, potato and crops (cutus, broadcage, Antirhum, Gernal, Propersion, Raphanus, Shapais, Artopa, Antirhum, Hemerocallis, Remesia, Cucumis, Browns, Solanum, Pennisctum, Ranneculus, Seculo, Salpidiossis, Cucumis, Engenise in Propersion and Patters and

Morel mannose-specific and sugar specifically aggregatable lectin from bark of the Japanese pagoda tree (sophora japonica).";

J. Biol. Chem. 266:3146-3153(1991).

-!-FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS

-!-FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS

STOCKS OF NITROGEN DURING ACTIVITY IS LOST AT PH BELOW 6.

-!-FUNCTION: BARK LECTINS ARE STORAGE PROPEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

J. Biol. Chem. 26:346-3163(1991).

J. FUNCTION: MANNOSE/GLUGOSE-BINDING BARK LECTIN. DISPLAYS

HEMAGGLUTINATING ACTIVITY AT PH 5-10, WITH A PH OPTIMUM AT 8-9.

FUNCTION: BARK LECTINS ARE STORAGE PROFIEIN THAT PROBABLE MAINTAINS
STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE
MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY
COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS
INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

-1. SUBUNIT: COMPOSED OF FOUR SUBUNITS OR ADOUT 30 KDA WHICH ARE POST-
TRANSLATIONALLY CLEAVED INTO A TWO SMALLER POLYPEPTIDES: A2 AND

C INDUCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MACHECLES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS (BY SIMILARITY).

C I SUBDINIT: HOMOTERRAMER OR HETEROFETRAMER OF MAHB AND MALB SUBUNITS.

I SIMILARITY: BELONGS TO THE LEGUMINOUS LECTIN FAMILY.

RESP: P19588; 11UL.

RESP: P19588; 11UL.

J. Biochem. 121, 756-761, 1997
A. Title: Stalic acid-binding motif of Maackla amurensis lectins.
A. Reference number: JC5444, MUID:97306060; PMID:9163528
A. Accession: JC5444
A. Molecule type: mRNA
A. Residues: 1-287 < YAM>
A. Molecule type: protein
A. Residues: 30-55,74-176;187-253 < YA2>
A. Molecule type: sprotein
A. Residues: 30-55,74-176;187-253 < YA2>
A. Experimental source: seed
C. Comment: This protein is a leguminous lectin. It interacts with high affinity with the galactosyl residues:
C. Superfamily: plant lectin
C. Keywords: glycoprotein
F. J-29/Domahis: slyans sequence #status predicted < SIG>
F. 30-287/Product: leukoagglutinin #status predicted < Nample F: 90,142,208,220/Binding site: carbohydrate (Asn) (covalent)

The permans W.J.;

A lectin and a lectin-related protein are the two most prominent proteins in the bark of yellow wood (Cladrastis lutea).";

Proteins in the bark of yellow wood (Cladrastis lutea).";

Plant Mol. Biol. 29:579-598(1995).

-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF WITROGEN DURING DORMANT PERTOD. SELF-AGGREGATABLE WOLKCULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

-!- SUBUNIT: HOMOTETRAMEN OF FOUR 32 kDa MONOMERS WHICH ARE POST-TRANSLATIONALLY CLEAVED INTO A TWO SUBUNITS: A AND B.

-!- SUBCLIANBOUS: BINDS ONE MANGANESE (OR OTHER TRANSLITION METAL) ION AND ONE CALCININAMENT OF SUBUNITS: A NOT THE METAL) ION AND ONE PROTEIN THAT PROVERTIES ON THE METAL IONS AND SUBUNITABLE OF THE STAND ONE THE TAND ONE THE METAL IONS AND SUBUNITABLE OF THE STAND ONE STAND STAND ONE STAND STAND ONE STAND STAND STAND STAND ONE STAND STAND STAND STAND STAND STAND STAND
